

Cloud Security & Green Data Centre Conference 2016

Enabling Trust and Green in Cyberspace

Background

Nowadays, the need for more cost-effective storage and software solutions together with mobile access has led to a rise in the adoption of cloud computing.

While the benefits of cloud computing are clear, the flexibility and openness of the cloud computing model has created a number of security concerns about the privacy integrity and availability of data.

In fact, apart of the cyber trust issues, the high running costs of data centre, is also another key problem to data centre owners as the energy cost of data centres is known to make up a significant percentage of a business operating costs.

In this conference, we are going to discuss the latest cyber security and data greening issues, explore the solutions to the above challenges and the latest market information of cloud security and green data centre applications !

DATE:	7 July 2016 (Thursday)
